

FOR IMMEDIATE RELEASE
SimWitty -- Alpha Release
United States, 19 June 2009

We are proud and excited to announce the alpha release of SimWitty: an open source Security Information Management system. The name is SimWitty because building Security Information Management tools makes you healthy and wealthy, witty and wise.

The mission of the SimWitty project is to develop information security professionals while developing information security software. Written in C# for .Net Framework 3.5 and available under the BSD license, SimWitty is a flexible framework for monitoring networks. The initial release provides network packet capture, Windows event log and syslog integration, and SQL Server Reporting Services (SSRS) reports.

The alpha release team is very excited to bring SimWitty to market and to provide developers and InfoSec professionals the opportunity to participate in its development. Please note that the SimWitty community's foundation is a spirit of collaboration and mentorship. For SimWitty, developing people is just as crucial as developing software.

We encourage all to access the SimWitty project site at <http://www.SimWitty.org> to download the alpha package, along with a ready-to-run virtual appliance.

We welcome all beginners as well as experts in the field as there are different projects and resources available. SimWitty is simple, smart and secure.
